MAT224H1S - Linear Algebra II
Winter 2013

Problem Set 5

- Due Tues. March 19, 6:10pm sharp. Late assignments will not be accepted.
- You may hand in your problem set either to your instructor in class on Tuesday, during S. Uppal's office hours Tuesdays 3-4pm, or in the drop boxes for MAT224 in the Sidney Smith Math Aid Center (SS 1071), arranged according to tutorial sections. Note: If you are in the T6-9 evening class, the problem set is due at 6:10pm **before** lecture begins.
- Be sure to clearly write your name, student number, and your tutorial section on the top right-hand corner of your assignment. Your assignment must be written up clearly on standard size paper, stapled, and cannot consist of torn pages otherwise it will not be graded.
- You are welcome to work in groups but problem sets must be written up independently - any suspicion of copying/plagiarism will be dealt with accordingly and will result at the minimum of a grade of zero for the problem set. You are welcome to discuss the problem set questions in tutorial, or with your instructor. You may also use Piazza to discuss problem sets but you are not permitted to ask for or post complete solutions to problem set questions.

1. Textbook, Section 4.5, **3**.

2. Textbook, Section 5.3, **6(b)**.

3. Rewrite $(a_1x_1 + a_2x_2 + \cdots + a_nx_n)^2$ in the form $x^T Ax$, where A is symmetric.

4. Identify and sketch the conic section given by $7x^2 + 2\sqrt{3}xy + 5y^2 = 1$.

5. Consider the vector spaces $P_2(\mathbb{R})$ with inner product

$$\langle p(x), q(x) \rangle = p(-1)q(-1) + p(0)q(0) + p(1)q(1).$$

Let $T: P_2(\mathbb{R}) \rightarrow P_2(\mathbb{R})$ be defined by $T(p(x)) = p'(x)$. Find $T^*(p(x))$ for an arbitrary $p(x) = a + bx + cx^2 \in P_2(\mathbb{R})$.

6. Assume T is a linear operator on \mathbb{R}^3 , that $\alpha = \{(1, 1, 1), (1, -1, 0), (0, 1, -1)\}$ is a basis of \mathbb{R}^3 consisting of eigenvectors of T and that the corresponding eigenvalues of T are the real numbers a, b , and c . Prove that T is self-adjoint if and only if $b = c$.

7. Let V be an n -dimensional inner real product space and let $\alpha = \{v_1, v_2, \dots, v_n\}$ be an orthonormal basis for V . Let W be a subspace of V with orthonormal basis $\beta = \{w_1, w_2, \dots, w_k\}$. Let $A = ([w_1]_\alpha [w_2]_\alpha \dots [w_k]_\alpha)$ and let P_W be the orthogonal projection onto W .
- (a) Show $[P_W]_{\alpha\alpha} = AA^T$.
- (b) Show $[P_W]_{\alpha\alpha}^2 = [P_W]_{\alpha\alpha}$ and $[P_W]_{\alpha\alpha}^T = [P_W]_{\alpha\alpha}$.

Suggested Extra Problems (not to be handed in):

- Textbook, Section 4.5 **1, 2, 4, 5, 8**
 - Textbook, Section 4.6 **1-5, 10, 14, 16**
 - Textbook, Section 5.3 **6(a), 10, 11, 12**
 - A linear transformation $T: V \rightarrow V$ is said to be **orthogonal** iff for every $x \in V$, $\|T(x)\| = \|x\|$ (i.e. T is length-preserving).
- (a) Prove that T is orthogonal iff $\langle T(x), T(y) \rangle = \langle x, y \rangle$ for all $x, y \in V$.
(Hint: $\|x + y\|^2 - \|x\|^2 - \|y\|^2 = 2\langle x, y \rangle$. You must show this though if you use it. Just expand the left hand side.)
- (b) Prove T is orthogonal iff T maps an orthonormal basis $\{x_1, x_2, \dots, x_n\}$ to an orthonormal basis $\{T(x_1), T(x_2), \dots, T(x_n)\}$.
- (c) Let $\alpha = \{x_1, x_2, \dots, x_n\}$ be an arbitrary orthonormal basis for V . Prove that T is orthogonal iff $[T]_{\alpha\alpha}$ is an orthogonal matrix.

Hint: See Textbook, Section 4.6, **4, 5**.
