

AUSTRALIAN NATIONAL UNIVERSITY
RESEARCH SCHOOL OF FINANCE ACTUARIAL STUDIES, AND
APPLIED STATISTICS

INTRODUCTION TO BAYESIAN DATA ANALYSIS (STAT3016/4116/7016)
SEMESTER 2 2016

FINAL PROJECT

DUE DATE: Thursday 27 October 2016, by 4pm
(50% of total course grade)

GENERAL DESCRIPTION

For the final project you will analyse a dataset of your choice using any appropriate Bayesian method we have discussed in class. You will need to formulate your own research question(s), and apply your knowledge of Bayesian statistics and computational strategies to answer your chosen question(s).

The dataset could be one of academic or personal interest to you, and that fits one of the Bayesian methods discussed in class (or some closely related Bayesian method that you can implement). Your chosen dataset should be a real data set which you have not analysed before and which has not been analysed in a textbook.

Some datasets have been posted on the course website and you may choose to use one of these for your project.

The final project is to be done individually. University policies on plagiarism will be **strictly** enforced.

You must submit a written report to communicate your project findings. There will be no oral presentation. Guidelines for the report are provided below.

Please include the following sections in your report:

- **Introduction:** Explain the background to your research question and state the dataset you are using. What are the main issues or problems to be addressed?
- **Methodology:** include a description of your choice of prior distribution(s) and sampling model(s) and specify your posterior distribution(s). Be sure to define all notation and state any assumptions you make on the study design and methodology. If you are implementing an MCMC algorithm, please provide details of your algorithm. Describe the variables to be used in your analysis. Explain why your methods are justified.
- **Results:** Describe the main findings of your project. Include graphs if appropriate and the results of any model checking which you performed.
- **Conclusions:** Summarize the main findings of your project. What did you learn? What are the key points that a reader should take away? Briefly describe any next steps that you would take to extend your analysis if you had more time or additional resources.
- **Self-criticism:** Discuss any limitations of your analysis, for example, did you need to make any simplifying assumptions or hack your code to get something working? This is an opportunity to reflect on how you would improve your code/analysis if given the opportunity to redo the project.
- **Appendices:** Attach the main code files for your analysis. If applicable you may also include any detailed mathematical derivations in the appendices that do not need to be contained in the main body of the report.
- **Reference List:** If applicable.

Total length: no more than 12 pages (excluding appendices).

PROJECT PROPOSAL

You may submit a short project proposal no later than Thursday 22 September 2016 (or earlier). The project proposal is not graded. It exists primarily for you to get feedback on your project idea and to make sure you have started thinking about your project. The proposal should comprise up to one page addressing the following questions:

- Which data set are you using?
- What are the main issues or problems to be addressed?
- What variables in the data set will you use?
- What are your initial thoughts on appropriate models/distributions?
- What questions and/or concerns do you have about the project?

PROJECT GRADING GUIDELINES

I will be looking for the following characteristics:

1. **Consistency:** Did you answer your question(s) of interest?
2. **Clarity:** Is it easy for the reader to understand what you did and the arguments you made?
3. **Relevancy:** Did you use Bayesian statistical techniques wisely to address your question?
4. **Interest:** Did you tackle a challenging, interesting question?

Some tips:

- State your question(s) up front, and use statistical modelling to help answer it. The models should not drive the question; the question should drive the models.
- Talk to the teaching staff for advice.
- Be selective with computer output in the appendix to help clarity.
- If you are using techniques we learned in class, you do not need to re-explain the theory behind the techniques. If you are using techniques that we did not cover in class, the techniques should be clearly explained in your report.
